**OBJECTIVES:** This study aims to report the clinical case of a patient with unilateral cleft lip and palate in an orthodontic treatment associated with orthognathic surgery. **REPORT:** On dependence of cleft lip and palate involvement, the cleft can induce to malocclusion in a variable severity regarding the discrepancy of the sagittal relationship between the bone bases, with facial aesthetic implications, involving the treatment prognosis. Among these malocclusions, sagittal maxillary deficiency follows the patient with cleft lip and palate, which can be treated in an orthodontic treatment or combined with orthognathic surgery. **CONCLUSION:** Orthodontic treatment associated with orthognathic surgery becomes complete to seek aesthetic recovery and occlusal adjustment combined with the integration and psychosocial realization of the patient.
